

ECFD Test 2 — what happens with your recordings

For the team members recording the simulated calls · prepared by Ahmed Abusetta · October 2026

باختصار: التسجيلات بتاعتكم هتتجمع وتترتب في 17 مكالمة كاملة (متصل وموظف). هنجرب عليها كذا برنامج لتحويل الكلام لنص، وكذا موديل ذكاء اصطناعي بيحلل المكالمة، ونشوف مين فيهم أحسن في إنه يكشف النصب ومن غير ما يعمل إنذار غلط على المكالمات العادية. أحسن نتيجة هي اللي هنكمل بيها في المشروع. التسجيلات هتفضل عندنا بس للاختبار، مش هتترفع على GitHub، ومش هنستخدمها في تدريب أي موديل غير لما نستأذنكم الأول.

1. Why we're recording

ECFD listens to phone calls and warns the employee when a caller is trying to scam them. To know if it really works, we need **real voices in realistic calls**, not typed text. That's why each call has a caller and an employee recorded by different people.

- **17 calls, 105 lines in total.** Each of you records 12–15 lines.
- **12 of the 17 calls are normal** (a supplier, a customer, a meeting, a printer problem...). That's on purpose: in real life most calls are normal, and a good system must **not** raise false alarms on them.
- **5 calls are scams** (asking for a CVV, an OTP, a "safe account" transfer, remote access, an approval trick).

2. What happens to your recordings

Stitching joins the caller's and the employee's lines in order with short natural pauses, so each call sounds and behaves like a real phone call. Each line is also converted to phone quality (8 kHz), which is what the system hears on a real company phone line.

3. Test A — speech-to-text: which one understands us best?

Every line goes through several speech-to-text engines. We compare what each one wrote with what you actually said.

Engines we compare	What we measure
Cohere Transcribe Arabic	• Risky words caught: code, OTP, password, CVV, card number, transfer, AnyDesk... • Mistakes: how many words it gets wrong, on normal and on scam calls • Speed: seconds per line
QwenCleo (Egyptian-tuned)	
Whisper (including our teammate's version)	
Speechmatics (current cloud service)	

4. Test B — the AI analyst: which one judges the call best?

The best speech-to-text output is then fed, turn by turn, to several AI models that follow the whole conversation and give a risk score, exactly like they would during a live call.

AI models we compare	What we measure
GPT-OSS-120B (current, cloud) Qwen3.6-35B Karnak-40B (Egypt's national model) GPT-OSS-20B The last three can run on a company's own server.	• Scams caught in time: before the employee would give the secret away • False alarms on the 12 normal calls • How early the warning comes • Consistency: same call, same score • Honest evidence: it only quotes words that were really said • Reliability and speed: seconds per turn, broken answers

We also run the same calls from the written scripts. The difference tells us how much speech-to-text mistakes cost the system.

5. What comes out

- A short **results report:** the winner in each test and the **best overall combination** of speech-to-text and AI model, with its speed and cost.
- The project continues with that combination.
- The 17 stitched calls also become our **demo-day backup:** real calls we can play through the system if the live phones fail.

6. Your recordings and your privacy

- **Only for ECFD testing.** They're kept on the project lead's laptop.
- **Never on GitHub.** The repository is public, so recordings, names and transcripts are blocked from being uploaded.
- **Where your voice goes:** only to the speech-to-text engines being tested — our own cloud GPU account (Modal) and, if included, Speechmatics' service. The AI analysts only receive the **written text**, never your voice.
- **No training without asking.** If we later want to use recordings to train (fine-tune) a model for Egyptian Arabic, we'll ask each of you first.
- **You can change your mind.** Ask anytime and your recordings will be deleted.

7. What we need from you

1. Record your lines from your list, one file per line.
2. Name each file with your name and the line number (for example **Ola 1, Ola 2**). The four Ahmeds: please use your full name (**Ahmed Ehab 3**).
3. Send all your files to Ahmed Abusetta as Documents on WhatsApp or on Drive.
